Selection is easy with Timing Pulleys and Belts automatic calculation tool available at:  
[http://fawos.misumi.jp/FA\\_WEB/pulley\\_sea/](http://fawos.misumi.jp/FA_WEB/pulley_sea/)

## [Step 1] Setting the Required Design Conditions

- (1) Machine Type (2) Power Transmission (3) Load Variances (4) Operation Duration per Day (5) Small Pulley Rotational Speed  
(6) Rotation Ratio (Lg. Pulley # of Teeth / Small Pulley # of Teeth) (7) Shaft Center Distance (Interim) (8) Pulley Diameter Limitation (9) Other Usage Conditions

## [Step 2-a] Calculating Design Power.....MXL/XL/L/H/S\_M/MTS\_M/T Series

• Design Power (Pd) = Transmission Power (Pt) x Overload Factor (Ks)

• Calculate Transmission Power at Motor Rated Power Output. (It is ideal to calculate from the actual load applied to the belt.)

• Overload Factor (Ks)=Ko+Kr+Ki

Overload Factor (Ks)=Lo+Kr+Ki

Ko : Overload Correction Factor (Table 1)

Kr : Rotation Ratio Correction Factor (Table 2)

Ki : Idler Correction Factor (Table 3)

\* When converting the torque (Tq) into transmission power (Pd), calculate the applicable values by using the following expressions.

Torque (Tq) = tqxKs

Transmitting Power (Pd) = Tqxn/9550

Tq : Design Torque (N-m)

tq : Transmission Torque

Ks : Overload Factor

Pd : Design Power (kW)

n : Speed (rpm)

i. If the maximum torque is used once or twice per day, calculate the design power by assigning "the load correction factor (Ko) = 1.0" to the expression for the overload factor and then, by multiplying the maximum torque by the overload factor (Ks) derived from the said expression.

ii. If the maximum torque is used very often, calculate the design power by multiplying the maximum torque by the applicable overload factor (Ks).

<For Timing Belts based on Spindle Motor>

Calculate the design power by calculating the transmission power from the basic rotation speed and then, by multiplying it by the applicable overload factor (Ks).

<For Timing Belts based on Linear Drive>

Calculate the design power by using the following expressions.

Te=mxα

Pt=TexV/1000

Pd=PtxKs

Te : Effective Tension (N)

m : Mass (g)

α : Acceleration (m/sec<sup>2</sup>)

V : Belt Speed (m/sec)

Pt : Transmission Power (KW)

Pd : Design Power (kW)

Ks : Overload Factor

## About Pulley Alignments

Misaligned pulleys may cause early belt failure and flange damages. Align as show below

## Names of Belt Components

## Examples of Belt Replacement Signs

Examples	Condition
1. When belt tooth reinforcement fabric is worn and rubber/core wire are exposed When tooth surface/grooves are worn and rubber/core wire are exposed	
2. When the backing rubber shows cracks due to hardening	
3. When cracks reaching the rubber are seen at tooth base	
4. Belt side faces are damaged due to wear	
5. When missing tooth can be seen	
6. When excessive wear can be seen on belt back side	
7. When belt or core wire are broken	

These are belt replacement timing guides. Early or periodical replacements are recommended even the signs shown above are not yet visible.
